

B2B Lead Research to CRM Draft

Public business sources + executable Python pipeline + interactive Excel

12 SOURCE ROWS	10 UNIQUE ACCOUNTS	2 DUPLICATES HELD	0 CONTACTS
----------------	--------------------	-------------------	------------

BUSINESS QUESTION

How could an appointment SaaS identify relevant service businesses, preserve evidence, and prepare an auditable CRM account import without mistaking public company research for verified purchase intent?

WORKING SYSTEM

I researched ten real South African companies on their official sites, recorded the source and observed signal, then built a standard-library Python pipeline. It normalizes names, flags duplicates, scores what to research next, and exports an exception queue, CRM account draft, campaign hypotheses and a SHA-256 run manifest.

FIELDWORK / B2B ACCOUNT INTELLIGENCE

Public company research | South African appointment businesses | 29 Sep 2026

Workflow gate	Count	Segment	Accounts	Priority A
Source rows	12	Barber	3	1
Unique researched accounts	10	Beauty	3	2
Duplicate review	2	Spa	3	3
A / research	7	Wellness	1	1
Existing platform or app	3			
Verified buyers	0			
Sales ready	0			
Step	Output and control			
Find accounts	Official company pages; no personal data			
Clean data	Normalized names; review duplicates before merge			
Prioritize	Observed signals; no invented purchase intent			
Handoff	CRM account draft; buyer and need unverified			
A researched company is a candidate, not a verified sales lead. No messages were sent.				

WHAT THE NUMBERS MEAN

Ten companies passed the account-level quality gate; two intentionally repeated source rows remain in the review queue. Seven candidates received an A research tier from the documented heuristic. No buyer, need, personal contact, outreach or sales result was verified.

Transparent sources and controls

Account-level research from official company pages; source URLs are clickable

QUALIFICATION AND DATA QUALITY

Score: location scale (up to 30) + category match (20) + evidence link (25) + booking signal (up to 20) + target market (5). An existing booking platform or owned app receives fewer booking points and triggers an integration discovery question. This is a research-order rule, not a prediction of a sale.

The raw CSV is preserved. Normalized company names trigger duplicate review; missing identity, source URL, evidence, market or date are held. Only unique account rows enter the CRM import draft. The Excel buyer/need fields start at No and can be updated after real verification.

PUBLIC SOURCE REGISTER

ACCOUNT	OBSERVED SIGNAL	SOURCE
Barber Club	11 listed branches	barberclub.co.za/branches
being	2 Sandton centres	being.co.za/
Sorbet	200+ salons; Zenoti booking	sorbet.co.za/salon
Perfect 10	Nationwide studio locator	perfect10.co.za/
Camelot Spa Group	16 branches, several countries	camelotspa.co.za/
Life Day Spa Group	11 locations; booking page	lifedayspa.co.za/book-a-treat...
Legends Barber	Owned booking app	legends-barber.com/
Sirina Thai Spa	13 spas; WhatsApp booking	sirinathaispa.co.za/
Hair City	2 named stores; advance booking	haircity.co.za/pages/faq
Hermanos Barbershop	Book Now; Loop Street branch	hermanos.co.za/

MARKETING AND HANDOFF

The campaign sheet groups accounts by segment, proposes a message to validate, and calculates research hours from editable assumptions. Experiments are marked Not launched. The CRM CSV contains company accounts at Research draft stage only; it is not an outreach list.

DELIVERABLES

Python source + repeatable CSV outputs + Excel workbook + field notes

No client engagement, verified contact, campaign conversion or revenue is claimed.
